How to Extract Multi-Part Archive Files

Sometimes products for download are large and are delivered in multi-part split files. For example, they may be a series of names that look like this:

FileName.zip.001 FileName.zip.002 FileName.zip.003

File formats you may need to extract include zip, tar, 001, gzip, dmg, rar, 7z, zipx, and many more. There are literally hundreds of archive file formats out there.

It's a simple process to get these files unarchived and working on your computer, once you know the process!
